

Disease & Pest Control for Larger Gardens

Roses will not give of their best unless the foliage is kept healthy. Regular and complete spraying (don't forget the underside of leaves) at suitable intervals with approved materials is the main secret of success with roses.

Fungicides:

Black Spot. Mancozeb Plus or Triforine Mancozeb washes off when rain is about and won't last. Roses need systemic sprays applied at least 3hrs before the rain for best results

Blackspot infection

Powdery Mildew. Wettable Sulphur or Triforine or Mancozeb Plus

Downey Mildew. Aus-Phoz or Mancozeb (not Mancozeb Plus) **Botrytis on Petal.** Mancozeb Plus

Root Rot by Searles is 200g/l Phosphorous Acid. will treat for Downey Mildew, Collar Rot, and phytophthora.

New Product Black Spot, Powdery Mildew, & Downy mildew Called Tombstone. SYSTEMIC. or AGI-FOS600 W both expensive but doesn't wash off

FONGARID you can use for all three problems.

Insecticides

General Pests (caterpillars, grasshoppers, grubs, bugs). Conguard or Malathon or Mavrik or Success

Aphids Malathon or Pyrethrum or Mavrik

Red Spider Mites (very damaging to foliage if left unchecked). Omite under leaves. Stealth is an alternative. You can also spray under the leaves with a pest oil.

Hibiscus Beetles (small black beetles) Conguard(systemic)

White Scale Apply Pest Oil mixed with Malathon after pruning,(Malathon is a wash off) or hose or scrub off with a long bristle brush or toothbrush, taking care not to damage eyes/shoots during the growing season.

Other Scales. Scrub or hose off - whatever works best. The most critical thing is to develop a spray regime early and to alternate Conguard or Malathon to avoid resistance.

WEEKLY SPRAY EXAMPLE:

Mixture of: Conguard and Mancozeb; or Mancozeb and Malathon; or Sulphur and an insecticide; or Triforine and an insecticide; or Copper and insecticide

Top Tips For Better Roses

TIME. Spend time caring for your Roses. Growing roses is a time consuming passion, that will reward you with lots of wonderful flowers. You should allow at least 1 to 2 hours per week for an average sized garden of 10-15 plants.

SOIL. Roses prefer a well drained soil, preferably sandy loam with a PH of 6.5. Most poorer soils can be improved to accommodate roses.

LIGHT. Roses require at least 5-6 hours of full sunlight per day. Plant a minimum of 3m- 4m away from large trees and palms to avoid root invasion and shading from sunlight by tall trees. Afternoon shade is OK.

MULCH. Keep surface of rose bed well mulched, with Lucerne hay, sugar cane mulch, old dry natural cow manure or lawn clippings. Mulching keeps weeds away and in summer, retains moisture and prevents heat burn from loose soil.

NUTRIENTS. (Fertiliser). Roses will only grow as well as you feed them. Fertilise in Spring, Summer and Autumn. We recommend Sudden Impact for Roses. Pamper your roses weekly in summer with liquid fertilizer such as Flourish or Fish Emulsion to promote healthy growth. (liquid triforte 3 months).

WATER. Deep water root systems weekly by soaking soil depending on the weather conditions. In windy, dry conditions, you should be prepared to check the soil every couple of days to ensure that moisture is still present in the soil underneath the mulch. 9 litres per bush per week is a minimum water requirement of roses.

SPRAYING. Regular spraying is essential for a healthy rose garden. Spray roses every one to two weeks to prevent black spot and other fungus diseases before they occur.

Email Address

I enclose \$30 (\$25 annual subscription + \$5 Joining Fee)

\$30 payment has been made by bank transfer
BSB 034-108 Account 706705

Please include your last name on the payment description when paying by bank transfer.

I understand annual subscriptions (\$25) are payable on or before July 1st each year.

SignedDate

Tick I do not want to receive correspondence from Neutrog Fertilizers regarding special offers, product information and samples. Neutrog offer discounts for members.

Note: New Members joining after the 3rd Wednesday in January are deemed to have joined starting on July 1 that year and are therefore paid up until June 30 of the following year. They do not receive the current year's Australian Rose Annual.

Brief Cultural Notes for Qld

BED PREPARATION.

The rose bed should ideally be prepared at least several months before planting time. It should be in a sunny spot and have good drainage. Make a test hole and fill with water to see how long water takes to drain away. If it drains very slowly, you have a drainage problem to overcome. Either select a better spot or temporarily remove the top soil and dig deep channels in the subsoil and insert porous pipes or coarse material. You may also choose to build up the garden bed above the existing level. It's no good just digging a hole in tight clay soil and planting a rose in it.

PLANTING.

Bare root roses (winter months): Spread the roots over a cone-shaped mound formed in the bottom of the planting hole, which should be large enough to accommodate the roots without their being bent. Very long roots may be trimmed to fit the hole. The mound's height should be adjusted so that the bud union is 25-50mm above the bed's surface. Partly fill the hole to within about 5cm, gently firming the soil. Fill the rest of the hole with water and allow to drain, then completely fill with soil. Wet the hole again so that the ground resembles wet slurry. Do not apply fertilizer at planting time. Water regularly for 10-12 days after planting to keep the soil moist. New plants may be fertilized after they have started strong growth, usually in spring.

Roses in pots (almost any time): Don't break the rootball and keep watering it after planting as a pot plant for the first 3 months until it breaks into strong growth. For winter planting you can carefully tease out the roots to straighten them if they have coiled, then plant it like a bare root rose.

FERTILISING

Always thoroughly water the bed before applying fertilizer. The simplest way to remember to fertilize is to do it when you have a change of seasons. Use fertilizer at the start of spring, summer, and autumn. Use a pellet form seaweed based soil conditioner like Seamungus at the start of winter or just after you prune. Lightly water in after application.

GENERAL CULTURE.

A healthy rose bush is more likely to be free of disease than one that is struggling. Mulching, fertilizing and good watering are required for healthy roses. If the soil is drier than the roots, then the plant desiccates rather than taking in nutrients and hydrating. A dry plant is a weak plant, exposing itself to attack from harmful bacteria and fungi. A good soak (check for good deep penetration of the water) twice a week in summer and weekly in winter is much better than a little every day. Regularly remove spent blooms or cut flowers 5 mm above a healthy leaf node on the flowering stem to promote quality regrowth and constant supplies of blooms. Remove any dead or diseased wood during the flowering season, to keep the plants tidy. Supplement the spray mixture with foliar fertiliser. Stake strong new basal growth until it has hardened to avoid it being broken off by wind or weight of rain.

Organic Rose Care for Qld

Organic rose growing is possible in subtropical and tropical climates but usually is more successful in temperate and cold areas. Humidity is often the instigator of fungal disease. A preventative spray regime with organic products will still give a better end result if you have the time to do so.

The key remains picking disease resistant plants. There are many commercially available organically certified fungicides and pesticides to help you. OCP in Australia produces products such as "eco-rose", "eco-fungicide", and "eco-oil" that are recommended by many organic rose growers.

Qld Rose Care Books

For more detailed advice on rose care get a copy of one of the books written by Queensland Rose Society Past President, Paul Hains.

"Growing Roses" is written for all climates with specific details for Subtropical and Tropical rose growing. It retails for \$35. (224pages) see www.qld.rose.org.au
